

Investment Strategy

Halcones strategy was created during the time span from 2009 to 2013. From 2011 to 2015 the system was tested on demo and live accounts and improved all the time, now it is fully launched for Forex Account Management. The strategy had two main tasks: Get as high profit from the current market as possible. Manage it successfully with as little drawdown as possible.

Halcones uses only mathematical formulas to enter market. If the market goes against the trader, then both, grid trade and intelligent lots increase methods, so the bargain series can be closed with profits.

The expected monthly return is about 8-15%. Maximal DD is about 40 %. Please take in account that during the summer months and the Christmas time the system's profit can be smaller. In your investment strategy you have to understand that the minimal investment is no less than 5000 USD, and every investment time should not be shorter than 3 months.

Risk Management

Halcones strategy has some defense levels. Even though the Halcones sell up to 6 - 8 currency pairs at the same time, its defense mechanisms control , both, the opened currency pair orders, and all the opened orders in total. In the Halcones strategy everything has been done to protect your investments and earn high profitability.

The maximal DD can reach more than 40%. Please take in consideration that larger risk can achieve larger returns.If you invest in this strategy, you have to be patient and do not get stressed if the floating DD reaches 40 %. For better risk management Halcones uses news filtering. It means that System not open new market orders before and after important economic news.

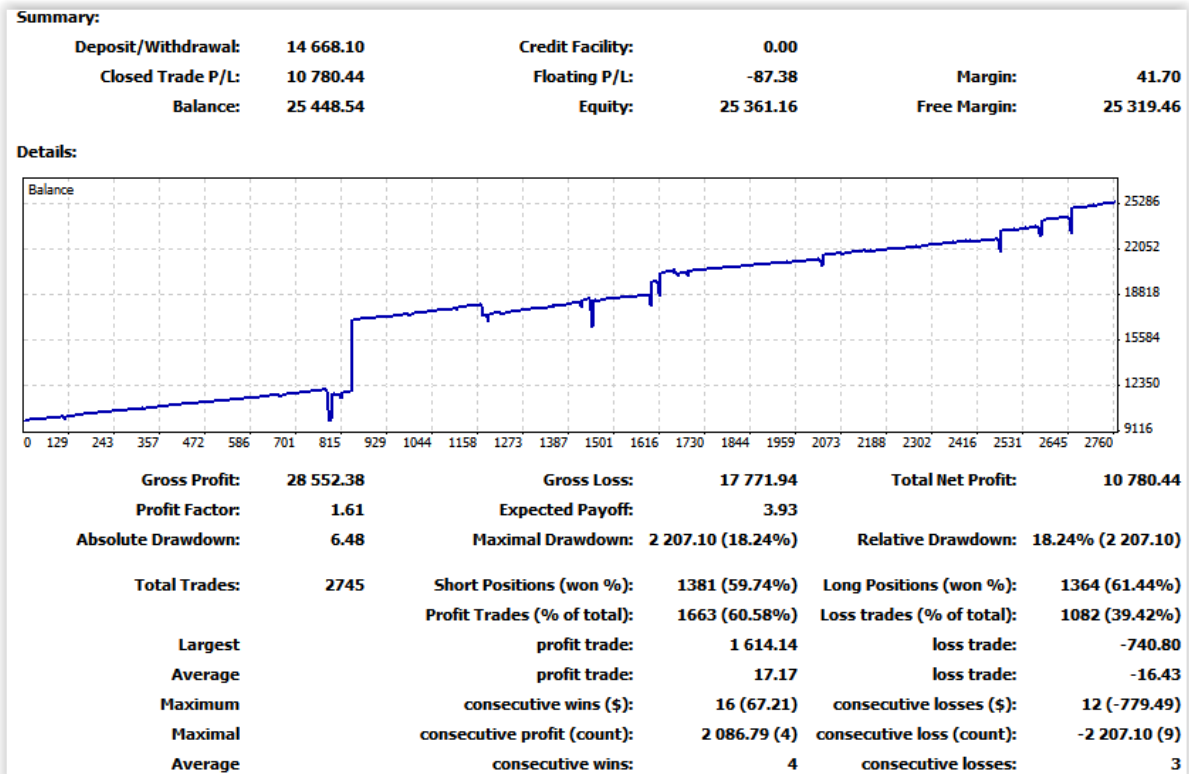

Account Management Highlights
